

**Project Name:**  
**Knowledge Jar**

**Database schema:**

Table for users:

id	int
Fname	varchar
Lname	varchar
Email	varchar
Phone	varchar
username	varchar
location	varchar

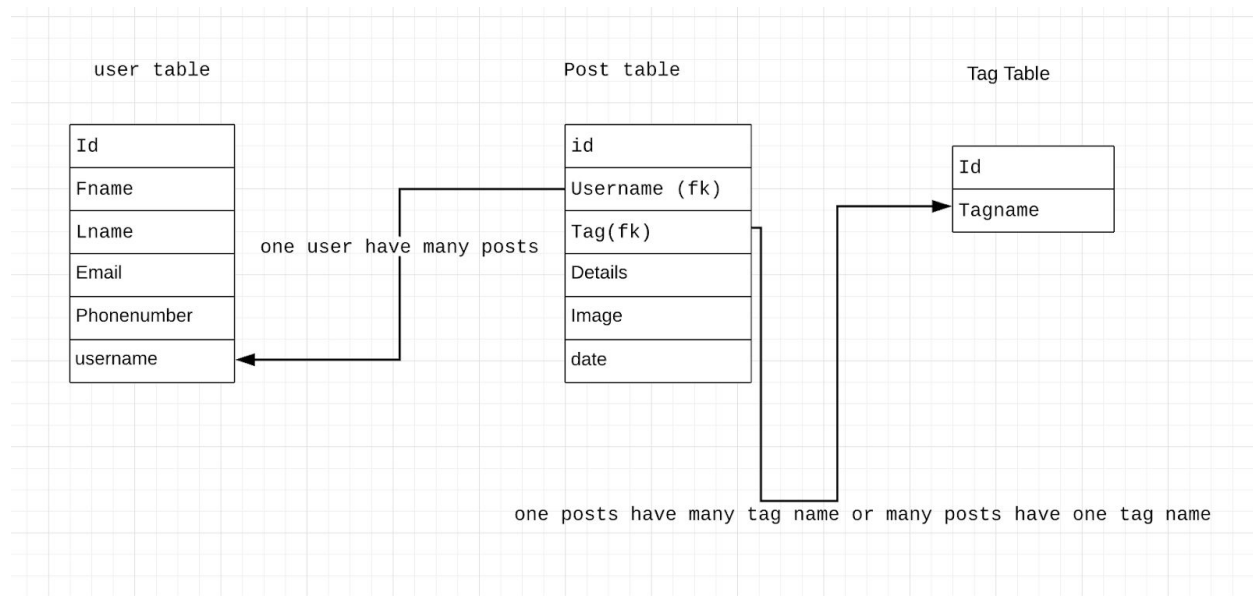

Table for tags:

id	int
name	varchar
description	varchar

Table for posts:

id	int
username	varchar
postname	varchar
tag	varchar
description	varchar

**ER Diagram:**

### Example:

Users can make as many posts as they want. So this describes one to many relations. Another way, many posts can't be made by the user because it is an educational website. So for understanding purposes, every post has an individual username.

Moreover, To make a filter for the posts every post has a tag name. And, one post can have many tag names. Also, many posts have one tag name.

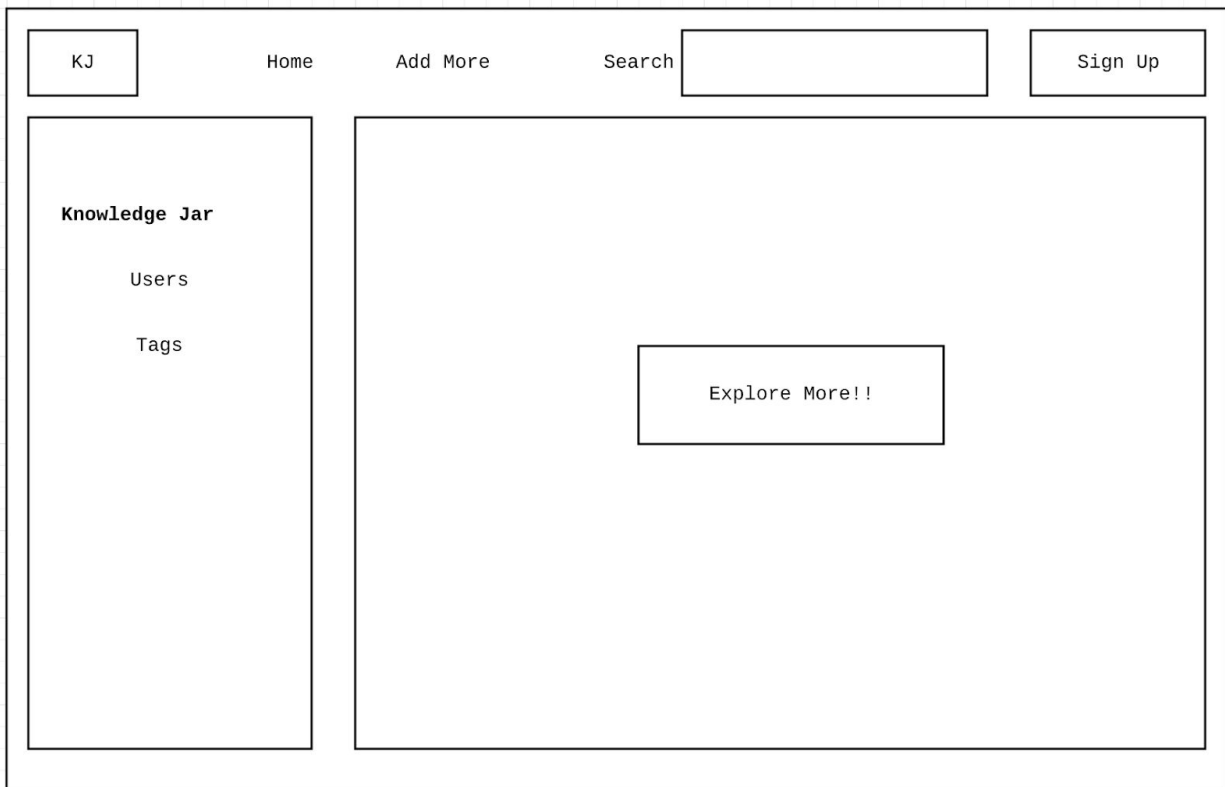

### Example:

1. Rocky a user on a website can make many posts using tag name(s). If he posts something related to 'Radar'. This kind of post contains two to three tags such as 'physics', 'astronomy', 'radar' or instead he can only use one tag which is 'radar' because basically it's about radar. So he can do it in both ways.

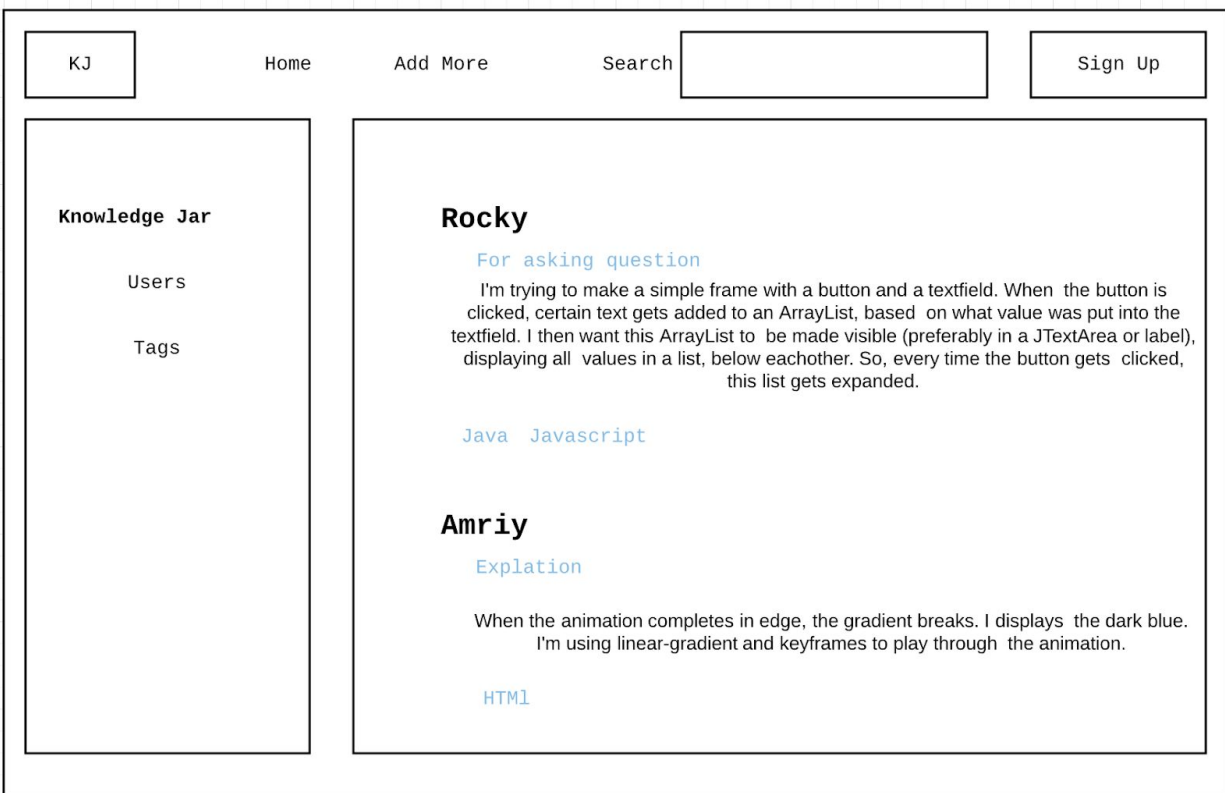

## **CURD:**

**Read:** This feature is for any user who could be the regular user or could be a new user. Here they can read every post made by our users. Also, they can see a list of users and tags.

Its about expalin..

I have two separate sections for a page that I am trying to build out. Layer 1 is over layer 2 and layer 2 is positioned fixed underneath so that it reveals after layer 1 is finished scrolling through content.  
I can't get the layers portion to work with what I have so far.

EditDelete

**Create:** This feature is for register users because they need the username to publish their posts. Here they can make any posts using tag name(s). By when they click on add more button they lent on a different page which will have some input fields by filling them and click on the “Add Post” button they can publish it.

Create Post

First Name:

Post Name:

Tag Name:

Description:

Add post

For the tag name it only allows you to pick you to the stored tag name. Here tag names can be chosen from the dropdown list.

Now if a user doesn't have a username to create a post, firstly they need to create a username. For this they need to signup with this website.
